Electrophoretic Investigation of Phospholipase C

of the enzyme of C1. oedematiens was at least 100-fold weaker. The results of the electrophoretic fractionating are recorded graphically on tables 1 - 3, From the obtained results it follows: 1.) Phospholipase C of the Varshavskiy-preparations behave like an electrophoretic homogeneous block with a mobility approximated to zero (at pH 8,6). The ferment of the Moscow preparations is electrophoretically heterogeneous. 2.) Phospholipase C of the Varshavskiy preparations after an electrophoretic fractionating entirely retain their original activity (in dissolved state). The enzyme of the Moscow preparations in the course of the experiment renders inactive (up to 70 % at TF-2). 3.) At fractional distillation of the Varshavskiy preparations a 26-fold cleansing of the isoelectric form of the phospholipase C with 50 % of the yield (referred to the total activity of the electrophoretically treated preparations) was obtained. At the occasion of such a fractionating of the Moscow preparations, previously cleansed 5 times by ethanol fractionating, a 18,5-fold total cleansing of the isoelectric form of the enzyme (with a yield of only 1,5 %) was obtained; the same succeeded for the negatively charged form of the ferment with an electrophoretic mobility near to $-2,5 \cdot 10^{-5} \text{ cm}^2/\text{sec}^{-1} \cdot \text{V}^{-1}$ 17-fold (yield 7 %). The electrophoregram of the phospholipase C of

Card 2/3

20-3-30/52

An Electrophoretic Investigation of Phospholipase C

Cl. oedematiens has 2 culminating points (tops). The main top of the phospholipase-C-activity corresponds to a protein of a high anode-mobility = $-6,5 \cdot 10^{-5} \text{ cm}^2/\text{sec.}^{-1} \cdot \text{V}^{-1}$. In the range of the zero-mobility the active protein is absent. That shows a new difference of species of the phospholipase C from Cl. perfringens and Cl. oedematiens. The peculiar difference of phospholipase C of the Moscow preparations of the α -toxin of Cl. perfringens from the same enzyme of the Varshavskiy-preparations, above all may be conditioned by the aging of the living culture (18 instead of 5 - 6 hours), as well as by dry preparations(more than 8 years). There are 3 figures, 1 table, and 10 references, 4 of which are Slavic.

A modified method of Van Heyningen (Biochem.J. 1941, 35, 1246) is presented. The modifications include: (1) constant relative concentration of substrate and calcium; (2) stoppage of reaction by cooling to 0°; and (3) spectrophotometric determination of turbidity at 815 m μ . Effects of time, temperature and pH on the action of the phospholipase on lecithin were studied. The pH optimum was found to be 6 to 6.5. Applications of this method to the determination of phospholipase C of Clostridium oedematiens and C. perfringens were made. Tsao - Ann Arbor, Mich.

1470. ONE OF THE METHODS OF SAVING NON-FERROUS
METALS IN URBAN DISTRIBUTION SYSTEMS.

M. D. Kamenskii, H. L. Alzamora, and N. I. Medvedskii

In Russian.

It is well-known that copper saving in urban power systems is achievable by replacing single large-section cables by cable pairs of smaller section. Hitherto this method was only used in 6-10 kV supply systems, but not in 6-10 kV distribution and 1.v. systems, because of increased lead consumption and also because the thermal stability of the small-section cables under short-circuit currents was insufficient. Since production of 1.v. cables without lead sheath has started and such cables will shortly be available for 6-10 kV, the first reason for not using double cables has been eliminated, and where the cable section is determined from the thermal resistance under short-circuit currents, advantage can be taken of this method of copper-saving. However, the primary costs also include those of cable-laying, and these may in some cases be fairly high, this depending on the kind of sealing of the roads which have to be remade (e.g. asphalt, diabase). The possibility and economy of the use of double cables therefore depends on how safe the circuits can be rendered by appropriate circuit layout and selective protection by fuses. Calculations for half-closed and return-loop systems are carried out for concrete cases, including exact determination of the selective fuse protection with cut-out times and experimental checks on the correctness of results. The method of determining the cable sections and selectivity of the fuse protection is fully confirmed as reliable in all the cases considered, which refer to a fairly wide selection of system variants.

TITLE: Plotting the aerodynamic profile of a defined mathematical function

SOURCE: Strojirenstvi, v. 13, no. 6, 1963, 415-423

TOPIC TAGS: aerodynamic profile, fourth degree algebraic equation, graphic construction, rectangular coordinate system, two variable function, kinematic and dynamic solution, blade profile

ABSTRACT: The article deals with the mathematical expression of the profile of a blade obtained by the transformation of a circle. A biquadratic equation with two variables and four coefficients is chosen as the function of the blade profile. The expressed profile is reduced to a circle either by graphic construction or by a relatively simple drafting machine with one degree of freedom. The geometric parameters for the graphic construction of the profile are investigated, the aerodynamic profile, the construction of tangents to any point of the considered profile, and the projection of the geometric parameters for the construction of the drafting machine for plotting the profile.

Card 1/2

L 14019-65

ACCESSION NR: AP3002919

are analyzed. The term "aerodynamic profile" is used to denote one of the lines determining the surface of the profile, as a graphic surface. In the solution of the problem, the point of departure is the analytical form of a function with two variables x and y defining the aerodynamic profile ($F(x,y) = 0$, expressed in a rectangular coordinate system x,y in the interval $a \leq x \leq b$ where a and b are real numbers. In this article only the most essential calculations are made. The complete kinematic and dynamic solution would be much longer and is not necessary to the present treatment. Orig. art. has: 16 figures and 63 formulas.

TITLE: The kinetics of grinding turbine blade configurations

SOURCE: Strojnický časopis, no. 1, 1965, 6-13

TOPIC TAGS: turbine blade manufacture, turbine blade grinding, blade configuration, grinding kinetics, automatic grinding

ABSTRACT: The kinetics of mechanical methods for grinding aerodynamic shapes such as turbine blades are discussed with a view toward replacing present methods of hand grinding with felt wheels or flexible bands. Asymmetrical conchoidal curves are first analyzed by elliptical diagrams to establish the geometrical laws and maximum precision obtainable without the use of copy patterns. On this basis, a mechanism composed of six members was developed (Fig. 1 of the Enclosure) to apply the grinding wheel to the work, as well as another variation (Fig. 2 of the Enclosure) in which the blade blank is pressed against the resilient grinding wheel. Further diagrammatic study produced a kinetic scheme for a nine-membered apparatus lying in one plane (Fig. 3 of the Enclosure) which cannot be blocked at any point and which applies the blade blank vertically against the wheel while twisting the work as required by predetermined measurements. This apparatus can
Card 1/4

L 41673-65

ACCESSION NR: AP5007764

2

also be used to analyze aerodynamic shapes by tracing their curves while gradually tightening the twists to desired positions. It can be used for the rough grinding of blade blanks if they are not too complicated in profile and if the resilient grinding wheel can be held in continuous contact with the work piece. "The authors thank Eng. Dr. J. Jerie, corresponding member of CSAV, for his suggestions as to the type and purposes of the apparatus." Orig. art. has: 11 figures and 1 formula.

TITLE: Relation between the laterality of the alpha-rhythm and hemisphere dominance

SOURCE: Ceskoslovenska psychiatrie, no. 6, 1965, 378-383

TOPIC TAGS: EEG, brain, injury

ABSTRACT: 955 routine recordings of EEG in patients without an organic lesion showed 40 cases of outspoken assymetry of the alpha-rhythm. In these patients the ectoderm-mesenchym relation on the ocular fundus was examined to determine the genotypically dominant hemisphere. There is a significant relation between the amplitude of the imposed rhythms and the dominant hemisphere. On the dominant side the amplitude of the imposed rhythms is lower. TOPIC TAGS: psychoneurotic disorder, hormone, gland, endocrinology

ABSTRACT: 20 cases with metrorrhagia caused by cystic glandular hyperplasia, histologically verified, are described. Psychotraumatizing factors are important in the development of the hyperplasia. Improvement in metrorrhagia was followed by psychopathological improvement; this picture included depression, anxious tensions, carcinophobia, vegetative stigmatization, and functional organ sensations. 65% of the patients had ancestors with psychiatric disorders. Clinical picture suggests a connection between psychic alterations and the surplus of estrogens and lack of progesteron. Orig. art. has: 2 tables. [Based on author's Eng. abst.] [JPRS: 34,161]

"Sex Chromatin of Neutrophil Leucocytes in Some Psychic Disorders."

Prague, Ceskoslovenska Psychiatrie, Vol 63, No 1, Feb 67, pp 45-49

Abstract: The authors investigated the occurrence of female sex chromatin in blood smears in emulsion paranoias, paranoid conditions, and in pedophilias. 28 psychiatric patients were used in the investigation. The theory that male patients who suffer from mental aberrations would show definite characteristics of female sex chromatin could not be confirmed. Among 20 men with homosexual tendencies and 4 women with Lesbian tendencies no definite conclusions could be drawn concerning the character of the sex chromatin. 4 Figures, 5 Tables, no references. "Relation Between the Chemical Structure, Antipyretic Activity, and Toxicity of Some Cinchophen Analogues."

Prague, Ceskoslovenska Farmacie, Vol 15, No 6, Jul 66, pp 291-293

Abstract /Authors' English summary modified/: Isomeric acids 6-methyl-2-(2-(or 3- and 4-)pyridyl)-cinchoninic and 2-(2-(or 3- and 4-)pyridyl)-cinchoninic were tested for antipyretic activity and toxicity. Antipyretic activity was determined in grey rabbits, toxicity in mice. 2-(2-pyridyl)-cinchoninic acid has a very strong antipyretic activity, 2-(3-pyridyl)-cinchoninic acid a very pronounced one, 6-methyl-2-(3-pyridyl) cinchoninic acid has a weak activity. Toxicity of these substances is lower than that of cinchophen, but higher than antipyrine. The most active substance is the most toxic one, its LD 50 is 470 mg/kg. 3 Figures, 1 Table, 12 Western, 4 Czech, 2 Egyptian, 1 East German reference. (Manuscript received 20 Dec 65).

Title : Illumination of Dark-Field Microscope in the Photo-Emulsion Measurement of Energy of Fast Neutrons.

Orig Pub : Magyar fiz. folyoirat, 1955, 3, No 2, 129-135

Abstract : By illuminating a dark-field microscope using an azimuth diaphragm placed in the plane of the aperture diaphragm of a condenser with a bright field, it was possible to see a large emulsion volume with small magnification and it became possible to observe only the trajectories with azimuth angles of $\pm 25^\circ$, i.e., only 28 -- 30% of all the trajectories encountered. In the case of low neutron intensity, this method facilitates considerably the detection of trajectories in the emulsion.

Title : Investigation of the Energy Spectrum of Neutrons from a Po-Be
Source, Using the Photographic Emulsion Method.

Orig Pub : Magyar Tud. akad. mat. es fiz. oszt. Koze., 1955, 5, No 4, 481-490

Abstract : The beryllium is bombarded with α -particles from a polonium point source. The neutrons of the $^{9}\text{Be}(\alpha, n)^{12}\text{C}$ reaction were recorded by means of the recoil electrons in a photographic emulsion. Approximately 12,000 tracks of protons were observed. The histogram of the tracks displays three maxima at 1.3, 4.4, and 6.9 Mev. The maximum neutron energy is 10.7 Mev. The spectrum observed by the author differs from those previously known and the difference can be explained by the special geometry of the experiment.

L-703. INVESTIGATION OF THE ENERGY SPECTRUM OF
 ^{14}N NEUTRONS FROM A Po-Ba SOURCE WITH THE PHOTOGRAPHIC
EMULSION METHOD. I. Medveczky.

Acta phys. Hungar. Vol. 11, No. 1, p. 77 (1958)

Thick-layered Ba was bombarded with α -particles of a small-diameter Po preparation. The distribution of neutron-emission energy associated with the $\text{Ba}^*(\alpha, n)\text{C}^*$ nuclear process was determined by the measurement of recoil-proton tracks incident in the nuclear emulsion. The energy spectrum obtained by the measurement of more than 13000 tracks showed three maxima (1.5, 4.1, 6.9 MeV) and the observed upper limit of neutron energy was 10.7 MeV. The distribution of energy observed showed considerable disagreement with results known from literature. This can be accounted for by the fact that the number of measurements contributing to the present result exceeds by far the number of measurements carried out by other authors. Furthermore, the divergence of irradiation geometry offers a very favourable opportunity of observation when a source of small diameter is used.

Title : Investigation of Sensitive Emulsions Agfa K2 with the Aid of
the Isotope I¹³¹.

Orig Pub : Acta phys. Acad. sci. hung., 1957, 7, No 1, 135-140

Abstract : To determine the sensitivity limit of K2 emulsions Agfa K2 plates 100 microns thick were saturated with the isotope I¹³¹ were dried in a stream of cold air and developed ten days after impregnation. Then the length of the electron ranges and the density of the grains in the tracks in the emulsion were measured in the developed plates. It is shown that the emulsions record satisfactorily tracks of electrons having energies up to 85 -- 90 kev. Tracks of higher energy electrons consist of individual very sparse grains. Measurements show that the number of high sensitivity grains (capable of recording tracks of high energy electrons) amounted to nearly 2--4% of the total number of grains in the K2 emulsion.

Title : Investigation of Radioactivity of Coal Ash by the Photo-emulsion Method

Orig Pub : Magyar tud. akad. Mat. es fiz. tud. oszt. kozl., 1957, 7,
No 2, 129-135

Abstract : The purpose of the work consisted of determining the concentration of uranium in grains of ash obtained when burning coal containing uranium. The results of the investigations, carried out by the photoemulsion method, have shown that in most cases the uranium fuses with the ash into small spheres of definite diameter and density, and the average contents of pure uranium in these spherical grains of ash reaches 0.65% approximately.

Preparation and properties of a new nuclear emulsion¹⁹
(Forte P/22). László Medvecky and Alfred Poister.
Magyar Tudományos Akad. Mat. és Fiz. Tudományok
Osztályának Közleményei 7, 145-62 (1957).—A nuclear emulsion was prep'd. for measurements of cosmic radiation, neutron energies from recoil protons, and low-intensity radiation, which requires long exposure times. It compared favorably with Agfa K2, Kodak NT4, and Ilford B1 emulsions, and gave almost identical d. energy plots as Ilford C2. The characteristic properties are humidity (air dried) 50%, AgBr 80.65%, gelatin 14.65%, and glycerol 2.35%. The nuclear emulsions were sensitized with org. compds., the best results were accomplished with 1-phenyl-2-methyl-3,5-bis(β -dimethylaminostryryl)-2-pyrazolinium iodide 6.5 mg./g. Ag. The range-energy relation was investigated with sources of Tb. daughters. Histograms prep'd. from the counting of 1600 tracks agreed with results from the literature. The sensitivity was detd. in emulsions exposed to cosmic rays at the Stalin peak in Bulgaria. Energy tracks 7910 μ long having an energy of 45.9 m.e.v. were observed. The inverse relation d. of Ag particle-energy was detd. from a 5154- μ proton track besides the 7910- μ track. The following energies can be registered in the emulsion, electrons to 0.03, mesons to 5.5, protons to 50, deuterons to 100, and α -particles to 1600 m.e.v. E. Rose

Title : Nomograms for Fast Neutron Spectroscopy

Orig Pub : Acta phys. Acad. sci. hung., 1957, 7, No 3, 373-377

Abstract : The measurement of the energy distribution of fast neutrons with the aid of photoemulsions represents a laborious problem. The difficulties increase particularly in the study of the spectrum of neutrons with a broad energy band. In processing the tracks, the authors propose to use two nomograms. The first nomogram gives the dependence of the proton energy and the angle between the direction of the proton and the plane of the plate on the depth of the track and the length of its projection on the plane of the plate. With the aid of a second nomogram, it is possible to determine the value of the angle

Card : 1/2

HUNGARY, Nuclear Physics - Installations and Instruments. Method of

AUTHOR: Medve茨ky, L.

TITLE: Neutron spectra of Po-Be and Ra-Be sources

PERIODICAL: Atomnaya energiya, v. 13, no. 6, 1962, 583 - 587

TEXT: The neutron energy spectra of Po-Be and Ra-Be measured by different authors show only qualitative agreement. Continuing earlier measurements (Atomnaya energiya, v. 13, no. 6, 1962; Acta Phys. Hung., 6, 261, 1956) the energy spectra of neutrons from two types of Po-Be sources were measured with 2μ Agfa-K2 emulsion plates. The sources came from USSR (source I) and from Great Britain (source II), their initial activity was $8.2 \cdot 10^6$ n/sec and $3.09 \cdot 10^7$ n/sec ($\pm 10\%$), both were cylindrical, 18.5 and 17 mm high, 189 and 67.1 mm³ of emulsion were scanned and 7662 and 4960 tracks were evaluated. The positions of the main peaks observed (3.1, 4.2, 4.8, 6.4, and 7.4 Mev) agreed for both sources, but the intensities differed, most for the 3.1 and 4.2 Mev peaks. Because of the differences in the shape of the neutron energy spectra obtained by different authors the mean neutron energy was

Card 1/2

Neutron spectra of...

S/089/62/013/006/011/027
B102/B186

found to vary also between 3.9 (Phys. Rev. 78, 799, 1950) and 5.58 Mev (source II). The Ra-Be source checked was a 12-mm high and 10-mm thick cylinder containing 50 mCu RaCl_2 . The measurements were made with Ilford-G2, Forte-P/22 and Agfa-K2 plates, 437 mm^3 of emulsion were scanned and 4174 tracks were evaluated. The neutron energy spectrum covered the region between 0.3 and 11.5 Mev, 70% of the intensity were between 1 and 6.5 Mev. The mean energy was 4.6 Mev. The results obtained differ somewhat from those obtained by other authors. There are 4 figures and 1 table.

(Vsesoyuznyy nauchno-issledovatel'skiy institut metrologii)TITLE: New data on Ce¹³⁵ decay [This paper was presented at the 15th Annual Conference on Nuclear Spectroscopy and the Structure of the Atomic Nucleus, held in Minsk from 25 January to 2 February 1965]

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v. 29, no. 12, 1965, 2205-2224

TOPIC TAGS: radioactive decay, cerium, electron spectrum, electron energy, radioisotope, gamma spectrum, electron transition

19

ABSTRACT: To verify the electron transitions of Ce¹³⁵ having energies of 87±1 and 120±1 kev, a new study was made of the conversion electron spectra of the isotope in the electron energy range from 42 to 85. Earlier studies had included energies up to 2660 kev, but since the energy of Ce¹³⁵ decay can reach 28000 kev, this study was extended from 2660 to 3090 kev. The results obtained are compared with those of K. Takahashi, et al., J. Phys. Soc. Japan, Vol. 19, No. 11, p 2014 (1964) in a table, and a systematic discrepancy is noted: the Japanese energy measurements are consistently lower (ranging from 0.3 to 2.7%) than those obtained in this paper.

TITLE: New data on the conversion electron spectra of La^{140} [This paper was presented at the 15th Annual Conference on Nuclear Spectroscopy and the Structure of the Atomic Nucleus, held in Minsk from 25 January to 2 February 1965.]SOURCE: AN SSSR. *Investiya. Seriya fizicheskaya*, v. 29, no. 12, 1965, 2250-2254

TOPIC TAGS: electron spectrum, lanthanum, spectrometer, electron energy

ABSTRACT: The purpose of this paper is to refine the data on the conversion electrons of La^{140} at energies above 2.2 Mev. The authors use the $2 \times 1/(2)^2$ beta spectrometer of the All-Union Scientific Research Institute of Metrology. Conversion lines of transitions both above and below 2200 kev are plotted in curves and tabulated. No lines were observed in the range from 2530 to 2830 kev. The line K432 was found to differ from earlier results. No evidence of doublet structure of the line K1596, claimed by Nakvi and Hogg (Phys. Ref. vol. 128, p. 357 (1962)), was observed. The authors thank L. N. Moskvin for preparing the sources. Orig. art. has: 3 figures and 2 tables. JPRS

TOTAL CROSS SECTIONS FOR THE PROTON-PROTON
INTERACTION IN THE ENERGY INTERVAL 410-660 MEV.
V. P. Dzhelisov (Dzhelisov), V. I. Monkhayev, and B. V. NU

Medved'. Translation of a pre-print from I.N.P. of A.C. S.S.R.

U.S.D.H. by M. E. Karelitz and L. W. Smillie. 10p.

Experiments to determine the total proton-proton interaction cross section at energies greater than 400 Mev have been performed using a collimated 660 Mev proton beam from a synchrocyclotron. Results are tabulated and indicate that the cross section increases rapidly with energy for energies exceeding 400 Mev. The total cross sections for inelastic processes (meson production) in this energy range have been determined from the measurements and available data on elastic p-p scattering. (M.P.G.)
